

**Basic Angles and Shapes Practice #6 (Extension)**

1.

Angle  $a = \dots\dots\dots$

Reasons =   
 .....  
 .....

2.

Angle  $b = \dots\dots\dots$

Reasons =   
 .....  
 .....  
 .....

3.

Angle  $c = \dots\dots\dots$

Reasons =   
 .....  
 .....  
 .....

4.

ABCDEF is a regular hexagon. Show AD is parallel to BC

Proof =   
 .....  
 .....  
 .....

## Answers: Basic Angles and Shapes Practice #6 (Extension)

1.

Angle  $a = 78^\circ$

Reasons =  $66^\circ$  as co-interior on  $\parallel$  add to  $180^\circ$

$$66 + a + 36 = 180^\circ \text{ (Angles on a line)}$$

(or  $114 = a + 36$  as alternate on  $\parallel$  are equal)

2.

Angle  $b = 76^\circ$

Reasons = Corresponding on  $\parallel$  are equal

$$\text{Angles on a line add up to } 180^\circ \times 2$$

Angles in a  $\Delta$  add up to  $180^\circ$

3.

Angle  $c = 50^\circ$

Reasons = Corresponding on  $\parallel$  are equal  $\times 2$

$$\text{Angles on a line add up to } 180^\circ$$

Base angles isosceles  $\Delta$  are equal

Angles in a  $\Delta$  add up to  $180^\circ$

4.

ABCDEF is a regular hexagon. Show AD is parallel to BC

Proof = Interior angles reg hex =  $(4 \times 180) \div 6$

$$\angle ABC = 120^\circ. \text{ AD cuts } \angle BAF \text{ in half so } \angle BAD = 60^\circ$$

$$\angle BAD + \angle ABC = 60 + 120 = 180^\circ$$

Angles co-interior to BC and AD add to  $180^\circ$ ,  
so the lines must be parallel
